GE1021 / GE2220 / GE2221 - PSPPKP

Week 2 Learning

Started on: Friday, 3 March 2023, 7:51 PM
State: Finished
Completed on: Friday, 3 March 2023, 8:00 PM
Time taken: 8 minutes 19 secs
Grade: 10.00 out of 10.00

Question 1
Correct
Mark 1.00 out of 1.00

Write a Python program to check if a year is leap or not.

If the year is evenly divisible by 4, it is a leap year, unless:

The year is evenly divisible by 100, it is not a leap year, unless:

The year is also evenly divisible by 400. Then it is a leap year.

This means that the year 2000 was a leap year, although 1900 was not.

Input Format

Input consists of a single integer, year

Output Format

Print 'Leap Year' if the year is a leap year, otherwise print 'Not Leap Year'

Sample Input

2000

Sample Output

Leap Year

Answer: (penalty regime: 0 %)

```
year = int(input())
if year%4==0:
    if year%100==0:
        if year%400==0:
            print("Leap Year")
        else:
            print("Not Leap Year")
    else:
        print("Leap Year")
else:
    print("Not Leap Year")
```

Input Expected Got

Input	Expected	Got
2000	Leap Year	Leap Year
1900	Not Leap Year	Not Leap Year
2004	Leap Year	Leap Year
2001	Not Leap Year	Not Leap Year

Passed all tests! ✓

Question 2
Correct
Mark 1.00 out of 1.00

Write a program that prints the prime numbers less than 20.

Input Format

No Input

Output Format

The first line contains all those prime numbers in ascending order separated by a space.

Sample Input

No Input

Sample Output

2 3 5 7 11 13 17 19

Answer: (penalty regime: 0 %)

```
for num in range(2,20):
    prime = True
    for i in range(2,num):
        if (num%i==0):
            prime = False
    if prime:
        print(num)
```

Input Expected Got

Input	Expected	Got
No Input	2 3 5 7 11 13 17 19	2 3 5 7 11 13 17 19

Passed all tests! ✓

Question 3
Correct
Mark 1.00 out of 1.00

Write a function that takes two lists and returns True if they have at least one common member.

Input Format

Input consists of two lines, each line contains a space separated sequence of integers

Output Format

Print True if there is a common element in both the lists, otherwise print False.

Sample Input

1 2 3 4 5
5 6 7 8 9

Sample Output

True

Answer: (penalty regime: 0 %)

```
def common_data(list1, list2):
    result = False
    for x in list1:
        for y in list2:
            if x == y:
                result = True
                return result
    return result
a = list(map(int, input().split()))
b = list(map(int, input().split()))
print(common_data(a, b))
```

Input Expected Got

Input	Expected	Got
1 2 3 4 5 5 6 7 8 9	True	True
1 2 3 4 5 6 7 8 9 10	False	False

Passed all tests! ✓

Question 4
Correct
Mark 1.00 out of 1.00

Write a function that returns the sum of multiples of 3 and 5 between 1 and limit (limit included). limit will be a positive integer.

Input Format

Input consists of a single integer, limit

Output Format

Print the sum of multiples of 3 and 5 between 1 and limit (inclusive)

Sample Input

10

Sample Output

33

Answer: (penalty regime: 0 %)

```
def sum_of_multiples(limit):
    sum = 0
    for i in range(1, limit+1):
        if i%3 == 0 or i%5 == 0:
            sum += i
    return sum
limit = int(input())
print(sum_of_multiples(limit))
```

Input Expected Got

Input	Expected	Got
10	33	33
20	98	98
7	14	14

Passed all tests! ✓

Question 5
Correct
Mark 1.00 out of 1.00

Write a function that counts the number of vowels in a given string. Consider only a, e, i, o, u as vowels in both upper and lower case for this problem.

Input Format

Input consists of a string in a single line

Output Format

Print the number of vowels in the string

Sample Input

Hello World

Sample Output

3

Answer: (penalty regime: 0 %)

```
def count_vowels(s):
    count = 0
    for i in s:
        if i in "aeiouAEIOU":
            count += 1
    return count
s = input()
print(count_vowels(s))
```

Input Expected Got

Input	Expected	Got
Hello World	3	3
Sky	0	0
Beautiful Day Today	7	7

Passed all tests! ✓

Question 6
Correct
Mark 1.00 out of 1.00

Write a function that takes a list of words and returns the length of the longest one.

Input Format

Input consists of a single line containing a space separated list of words

Output Format

Print the length of the longest word

Sample Input

hello world

Sample Output

5

Answer: (penalty regime: 0 %)

```
def find_longest_word_length(words):
    max = 0
    for i in words:
        if len(i) > max:
            max = len(i)
    return max
words = input().split()
print(find_longest_word_length(words))
```

Input Expected Got

Input	Expected	Got
hello world	5	5
Hi	2	2
Beautiful Day Today	9	9

Passed all tests! ✓

Question 7
Correct
Mark 1.00 out of 1.00

Write a function that computes the value of the given n-th term in Tribonacci sequence. The Tribonacci sequence is a generalization of the Fibonacci sequence where each term is the sum of the three previous terms. The sequence starts as follows: 0, 1, 1, 2, 4, 7, 13, 24, 44, 81, ... Given n, print the n-th element of Tribonacci sequence.

Input Format

Input consists of a single integer n

Output Format

Print the n-th element of Tribonacci sequence

Sample Input

6

Sample Output

7

Answer: (penalty regime: 0 %)

```
def tribonacci(n):
    if n == 0:
        return 0
    elif n == 1:
        return 1
    elif n == 2:
        return 1
    else:
        return tribonacci(n-1) + tribonacci(n-2) + tribonacci(n-3)
n = int(input())
print(tribonacci(n))
```

Input Expected Got

Input	Expected	Got
6	7	7
10	81	81
4	4	4

Passed all tests! ✓

Question 8
Correct
Mark 1.00 out of 1.00

Write a function that takes a list of numbers and returns a list containing only the elements that are greater than the average of the list.

Input Format

Input consists of a single line containing a space separated list of integers

Output Format

Print a list containing only the elements that are greater than the average of the list

Sample Input

1 2 3 4 5

Sample Output

[4, 5]

Answer: (penalty regime: 0 %)

```
def above_average(lst):
    avg = sum(lst)/len(lst)
    result = []
    for i in lst:
        if i > avg:
            result.append(i)
    return result
lst = list(map(int, input().split()))
print(above_average(lst))
```

Input Expected Got

Input	Expected	Got
1 2 3 4 5	[4, 5]	[4, 5]
10 20 30 40 50 60 70 80 90 100	[60, 70, 80, 90, 100]	[60, 70, 80, 90, 100]
1 2 3 4 5 6 7 8 9 10	[6, 7, 8, 9, 10]	[6, 7, 8, 9, 10]

Passed all tests! ✓

Question 9
Correct
Mark 1.00 out of 1.00

Write a function that computes the value of the given n-th term in Padovan sequence. The Padovan sequence is a sequence of integers defined by the following recurrence relation: P(n) = P(n-2) + P(n-3) for n > 2 P(0) = P(1) = P(2) = 1 Given n, print the n-th element of Padovan sequence.

Input Format

Input consists of a single integer n

Output Format

Print the n-th element of Padovan sequence

Sample Input

6

Sample Output

4

Answer: (penalty regime: 0 %)

```
def padovan(n):
    if n == 0 or n == 1 or n == 2:
        return 1
    else:
        return padovan(n-2) + padovan(n-3)
n = int(input())
print(padovan(n))
```

Input Expected Got

Input	Expected	Got
6	4	4
10	12	12
4	2	2

Passed all tests! ✓

Question 10
Correct
Mark 1.00 out of 1.00

All of a sudden you need money. The nearest convenience store is willing to buy your kidney for a handsome price. However, they only accept coins of certain denominations. Assume that you have an infinite supply of coins of each denomination. Given the denominations, find the minimum number of coins you need to make change for a given amount. If it is impossible to make change for the given amount, print -1.

Input Format

The first line contains the number of denominations.

The second line contains the denominations in a space separated manner.

The third line contains the amount you need to make change for.

Output Format

Print the minimum number of coins you need to make change for the given amount. If it is impossible to make change for the given amount, print -1.

Sample Input

3
1 2 5
11

Sample Output

3

Answer: (penalty regime: 0 %)

```
def min_coins(coins, amount):
    dp = [float('inf')] * (amount + 1)
    dp[0] = 0
    for coin in coins:
        for i in range(coin, amount + 1):
            dp[i] = min(dp[i], dp[i - coin] + 1)
    return dp[amount] if dp[amount] != float('inf') else -1
n = int(input())
coins = list(map(int, input().split()))
amount = int(input())
print(min_coins(coins, amount))
```

Input Expected Got

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Alfred buys an old scooter for Rs. X and spends Rs. Y on its repairs. If he sells the scooter for Rs. Z (Z>X+Y). Write a program to help Alfred to find his gain percent. Get all the above-mentioned values through the keyboard and find the gain percent.

Input Format:

The first line contains the Rs X

The second line contains Rs Y

The third line contains Rs Z

Sample Input:

10000

250

15000

Sample Output:

46.34 is the gain percent.

For example:

Input	Result
45500 500 60000	30.43 is the gain percent.

Answer: (penalty regime: 0 %)

```
x=float(input())
y=float(input())
z=float(input())
a=x+y
g=z-a
gp=(g/a)*100
print(f"{gp:.2f} is the gain percent.")
```

✓	4 12 3 6 8	12 8	12 8	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **3**

Correct

Mark 1.00 out of 1.00

Flag question

To find the frequency of numbers in a list and display in sorted order.

Constraints:

1<=n, arr[i]<=100

Input:

1 68 79 4 90 68 1 4 5

output:

1 2

4 2

5 1

68 2

79 1

90 1

For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

Answer: (penalty regime: 0 %)

```
A = list(map(int, input().split()))
for B in sorted(set(A)):
    print(B, A.count(B))
```

Question 1

Correct

Mark 1.00 out of 1.00

Flag question

An Autonomic number is a number in a certain whose square ends with the same number.

For example, 5 is an autonomic number because 5*5 =25. The last digit is 5 which is same

as the given number.

If the number is not valid, it should display "Invalid Input".

If it is an autonomic number display "Autonumber" else display "Not Autonumber".

Input Format:

Take a Integer from Stdin Output Format: Print Autonumber, if given number is Autonomic number,otherwise Not Autonomic number. Example Input: 5 Output: Autonumber Example Input: 25 Output: Autonumber Example Input: 7 Output: Not Autonumber

For example:

Test	Result
print(autobetter(5))	Autonumber

Answer: (penalty regime: 0 %)

Reset answer

```
def autonumber(n):
    n = int(n)
    return "Autonumber" if str(n).endswith(str(n*n))
```

Test	Expected	Got
✓ print(autobetter(5))	Autonumber	Autonumber
✓ print(autobetter(7))	Not Autonumber	Not Autonumber

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 2

Correct

Mark 1.00 out of 1.00

Flag question

An abundant number is a number for which the sum of its proper divisors is greater than

the number itself. Proper divisors of the number are those that are strictly lesser than the number.

Input Format:

Take input an integer from stdin

Output Format:

Return Yes if given number is Abundant. Otherwise, print No

Example input:

12

Output:

Yes

Explanation:

The proper divisors of 12 are 1, 2, 3, 4, 6, whose sum is 1 + 2 + 3 + 4 + 6 = 16. Since sum of

proper divisors is greater than the given number, 12 is an abundant number.

Example Input:

13

Output:

No

Explanation:

The proper divisors of 13 is 1, whose sum is 1. Since sum of proper divisors is not greater

than the given number, 13 is not an abundant number.

For example:

Test	Result
print(abundant(12))	Yes
print(abundant(13))	No

Answer: (penalty regime: 0 %)

Reset answer

```
def abundant(n):
    return "Yes" if sum(i for i in range(1, n) if n % i == 0) > n else "No"
```

Test	Expected	Got
✓ print(abundant(12))	Yes	Yes
✓ print(abundant(13))	No	No

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 3

Correct

Mark 1.00 out of 1.00

Flag question

complete function to implement cook change making problem i.e. finding the minimum

number of coins of certain denominations that add up to given amount of money

The only available coins are of values 1, 2, 3, 4

Input Format:

Integer input from stdin.

Output Format:

return the minimum number of coins required to meet the given target.

Example Input:

19

Output:

4

Explanation:

We need only 4 coins of value 4 each

Example Input:

25

Output:

7

Explanation:

We need 6 coins of 4 value, and 1 coin of 1 value

Answer: (penalty regime: 0 %)

Reset answer

```
def coinChange(n):
    coins = [1, 2, 3, 4]
    dp = [0] + [float('inf')] * n
    for coin in coins:
        for amount in range(coin, n + 1):
            dp[amount] = min(dp[amount], dp[amount - coin] + 1)
    return dp[n]
```

Test	Expected	Got
✓ print(coinChange(4))	4	4

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 4

Correct

Mark 1.00 out of 1.00

Flag question

Write a code to check whether product of digits at even places is divisible by sum of digits

at odd place of a positive integer.

Input Format:

Take an input Integer from stdin.

Output Format:

Print TRUE or FALSE.

Example Input:

1256

Output:

TRUE

Example Input:

1595

Output:

FALSE

For example:

Test	Result
print(productDigits(1256))	True
print(productDigits(1595))	False

Answer: (penalty regime: 0 %)

Reset answer

```
def productDigits(number):
    number = str(number)
    product_even = 1
    sum_odd = 0
    for i in range(len(number_str)):
        if int(number_str[i]):
            if (i + 1) % 2 == 0:
                product_even *= digit
            else:
                sum_odd += digit
    if sum_odd == 0:
        return False
    return product_even % sum_odd == 0

if __name__ == "__main__":
    try:
        number = int(input())
        if productDigits(number):
            print("TRUE")
        else:
            print("FALSE")
    except ZeroError:
        pass
    except ValueError:
        print("ValueError: Invalid input. Please
```

Test	Expected	Got
✓ print(productDigits(1256))	True	True
✓ print(productDigits(1595))	False	False

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 5

Correct

Mark 1.00 out of 1.00

Flag question

A number is considered to be ugly if its only prime factors are 2, 3 or 5.

1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, ...] is the sequence of ugly numbers.

Task:

complete the function which takes a number n as input and checks if it's an ugly number.

return ugly if it is ugly, else return not ugly

think

An ugly number U can be expressed as: U = 2^x * 3^y * 5^z, where x, y, and z are nonnegative integers.

For example:

Test	Result
print(checkugly(6))	ugly
print(checkugly(21))	not ugly

Answer: (penalty regime: 0 %)

Reset answer

```
def checkugly(n):
    if n == 1:
        return "not ugly"
    while n % 2 == 0:
        n = n // 2
    while n % 3 == 0:
        n = n // 3
    while n % 5 == 0:
        n = n // 5
    return "ugly" if n == 1 else "not ugly"
```

Test	Expected	Got
✓ print(checkugly(6))	ugly	ugly
✓ print(checkugly(21))	not ugly	not ugly

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 2
Correct
Mark 1.00 out of 1.00
Flag question

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

For example:

Input	Result
01010101010	Yes
01010110101	No

Answer: (penalty regime: 0 %)

```
def is_binary_string(s):
    binary_set = {'0', '1'}
    return set(s).issubset(binary_set)

s = input()
if is_binary_string(s):
    print("Yes")
else:
    print("No")

if __name__ == "__main__":
    main()
```

Input	Expected	Got	
01010101010	Yes	Yes	✓
REC123	No	No	✓
101011 10101	No	No	✓

Question 3
Correct
Mark 1.00 out of 1.00
Flag question

Given an array of string words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

In the **American keyboard**

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

Example 1

Input: words = ["Hello","Alaska","Dad","Peace"]

Output: ["Alaska","Dad"]

Example 2

Input: words = ["omk"]

Output: []

Example 3

Input: words = ["adsdf","sfd"]

Output: ["adsdf","sfd"]

For example:

Input	Result
4 Alaska Hello Dad Peace	Alaska Dad
2 omk adsdf sfd	omk adsdf sfd

Answer: (penalty regime: 0 %)

```
n = int(input())
words = [input() for _ in range(n)]
s1, s2, s3 = set("qwertyuiop"), set("asdfghjkl"), se
result = [word for word in words if any(c.lower
for c in result:
    print(c, end="\n")
else:
    print("No words")
```

Input	Expected	Got	
4 Alaska Hello Dad Peace	Alaska Dad	Alaska Dad	✓
1 omk	No words	No words	✓
2 adsdf sfd	adsdf sfd	adsdf sfd	✓

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question 4
Correct
Mark 1.00 out of 1.00
Flag question

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively

The next two lines contain the space-separated integer arrays to be compared.

Sample Input:

5 4

1 2 4 6 5

2 4 6 10

Sample Output:

1 5 10

3

Sample Input:

5 5

1 2 3 4 5

1 2 3 4 5

Sample Output:

NO SUCH ELEMENTS

For example:

Input	Result
5 4 1 2 4 6 5 2 4 6 10	1 5 10 3

Answer: (penalty regime: 0 %)

```
m, n = map(int, input().split())
set1 = set(map(int, input().split()))
set2 = set(map(int, input().split()))
set1 = set(arr1)
set2 = set(arr2)
symmetric_diff = set1.symmetric_difference(set2
non_repeating_elements = [x for x in symmetric
if non_repeating_elements:
    print(len(non_repeating_elements))
    print(*non_repeating_elements)
else:
    print("NO SUCH ELEMENTS")
```

Input	Expected	Got

Marks for this submission: 1.00/1.00.

Question 5
Correct
Mark 1.00 out of 1.00
Flag question

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letters on the keyboard that are broken, return the number of words in text you can fully type using this keyboard.

Example 1

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

For example:

Input	Result
hello world ad	1
Faculty Upskilling in Python Programming se	2

Answer: (penalty regime: 0 %)

```
s = input()
b = input()
c = 0
for char in s:
    if char in b and char not in c:
        c += len(char)
print(c)
```

Input	Expected	
hello world ad	1	✓
welcome to REC se	1	✓
Faculty Upskilling in Python Programming se	2	✓

Question **1**
Correct
Mark 1.00 out of 1.00
Flag question

Reverse a string **without affecting special characters**
Given a string S, containing special characters and all the alphabets, reverse the string without affecting the positions of the special characters.

Input:

A&B

Output:

B&A

Explanation: As we ignore '&' and
As we ignore '&' and then reverse, so answer is "B&A".

For example:

Input	Result
A&x#	x&A#

Answer: (penalty regime: 0 %)

```
S = input().strip()
S_list = list(S)
left = 0
right = len(S_list) - 1
while left < right:
    if S_list[left].isalpha() and S_list[right
        S_list[left], S_list[right] = S_list[r
        left += 1
        right -= 1
    elif not S_list[left].isalpha():
        left += 1
    elif not S_list[right].isalpha():
        right -= 1
result = ''.join(S_list)
print(result)
```

	Input	Expected	Got

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **2**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program to check if two strings are balanced. For example, strings s1 and s2 are balanced if all the characters in the s1 are present in s2. The character's position doesn't matter. If balanced display as "true" ,otherwise "false".

For example:

Input	Result
Yn PYnative	True

Answer: (penalty regime: 0 %)

```
s1 = input()
s2 = input()
print(set(s1).issubset(set(s2)))
```

	Input	Expected	Got	
✓	Yn PYnative	True	True	✓
✓	Ynf PYnative	False	False	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **3**
Correct
Mark 1.00 out of 1.00
Flag question

Given two Strings s1 and s2, remove all the characters from s1 which is present in s2.

Constraints

1<= string length <= 200

Sample Input 1

experience
enc

Sample Output 1

xpri

Answer: (penalty regime: 0 %)

```
s1 = input()
s2 = input()
s2_set = set(s2)
result = ''.join(char for char in s1 if char no

print(result)
```

	Input	Expected	Got

Marks for this submission: 1.00/1.00.

Question **5**
Correct
Mark 1.00 out of 1.00
Flag question

Given a string S which is of the format USERNAME@DOMAIN.EXTENSION, the program must print the EXTENSION, DOMAIN, USERNAME in the reverse order.

Input Format:

The first line contains S.

Output Format:

The first line contains EXTENSION.
The second line contains DOMAIN.
The third line contains USERNAME.

Boundary Condition:

1 <= Length of S <= 100

Example Input/Output 1:

Input:

abcd@gmail.com

Output:

com
gmail
abcd

Answer: (penalty regime: 0 %)

```
a=input("")
if not 1<=len(a)<=100:
    exit()
parts=a.split('@')
if len(parts)!=2:
    exit()
username=parts[0]
domainpart=parts[1].split('.')
if len(domainpart)<2:
    exit()
domain=domainpart[0]
extension='.'.join(domainpart[1:])
print(extension)
print(domain)
print(username)
```

	Input	Expected	Got	
✓	abcd@gmail.com	com gmail abcd	com gmail abcd	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **6**
Correct
Mark 1.00 out of 1.00
Flag question

String should contain only the words are not palindrome.

Sample Input 1

Malayalam is my mother tongue

Sample Output 1

is my mother tongue

Answer: (penalty regime: 0 %)

```
def remove_palindromes(sentence):
    return [word for word in sentence.lower().s
sentence = input()
print(*remove_palindromes(sentence))
```

	Input	Expected
✓	Malayalam is my mother tongue	is my mother tongue

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **7**
Correct
Mark 1.00 out of 1.00
Flag question

Two string values S1, S2 are passed as the input. The program must print first N characters present in S1 which are also present in S2.

Input Format:

The first line contains S1.
The second line contains S2.
The third line contains N.

Output Format:

The first line contains the N characters present in S1 which are also present in S2.

Boundary Conditions:

2 <= N <= 10
2 <= Length of S1, S2 <= 1000

Example Input/Output 1:

Input:

abcbde
cdefghbb
3

Output:

bcd

Note:

b occurs twice in common but must be printed only once.

Answer: (penalty regime: 0 %)

```
S1 = input().strip()
S2 = input().strip()
N = int(input())

common_chars = []
for char in S1:
    if char in S2 and char not in common_chars
        common_chars.append(char)
        if len(common_chars) == N:
            break
print(''.join(common_chars))
```

	Input	Expected	Got	
✓	abcbde cdefghbb 3	bcd	bcd	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **8**
Correct
Mark 1.00 out of 1.00
Flag question

In this exercise, you will create a program that reads words from the user until the user enters a blank line. After the user enters a blank line your program should display each word entered by the user exactly once. The words should be displayed in the same order that they were first entered. For example, if the user enters:

first

second

first

third

second

then your program should display:

first

second

third

Answer: (penalty regime: 0 %)

```
words = []
while True:
    try:
        word = input().strip()
        if not word:
            break
        if word not in words:
            words.append(word)
    except EOFError:
        break
print(*words, sep='\n')
```

	Input	Expected	Got	
✓	first second first third second	first second third	first second third	✓
✓	rec cse it rec cse	rec cse it	rec cse it	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **9**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program that takes as input a string (sentence), and returns its second word in uppercase.

For example:

If input is "Wipro Technologies Bangalore" the function should return "TECHNOLOGIES"

If input is "Hello World" the function should return "WORLD"

If input is "Hello" the program should return "LESS"

NOTE 1: If input is a sentence with less than 2 words, the program should return the word "LESS".

NOTE 2: The result should have no leading or trailing spaces.

For example:

Input	Result
Wipro Technologies Bangalore	TECHNOLOGIES
Hello World	WORLD
Hello	LESS

Answer: (penalty regime: 0 %)

```
sentence = input().strip()
words = sentence.split()
if len(words) >= 2:
    result = words[1].upper()
else:

    result = "LESS"
print(result)
```

	Input	Expected	Got
✓	Wipro Technologies Bangalore	TECHNOLOGIES	TECHNO
✓	Hello World	WORLD	WORLD
✓	Hello	LESS	LESS

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **10**
Correct
Mark 1.00 out of 1.00
Flag question

Assume that the given string has enough memory.

Don't use any extra space(IN-PLACE)

Sample Input 1

a2b4c6

Sample Output 1

aabbbbcccccc

Answer: (penalty regime: 0 %)

```
def expand_string(input_str):
    result = ""
    i = 0
    while i < len(input_str):
        char = input_str[i]
        i += 1
        count = 0
        while i < len(input_str) and input_str
            count = count * 10 + int(input_str
            i += 1
        result += char * count
    return result
input_str =input()
output_str = expand_string(input_str)
print(output_str)
```

	Input	Expected	Got
✓	a2b4c6	aabbbbcccccc	aabbbbcccccc
✓	a12b3d4	aaaaaaaaaaaabbbdddd	aaaaaaaaaaaabbbdddd

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **1**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number >= 1 and <= 25000.

Some examples are as below.

If the given number is 292, the program should return 1 because there is only 1 non-repeated digit '9' in this number

If the given number is 1015, the program should return 2 because there are 2 non-repeated digits in this number, '0', and '5'.

If the given number is 108, the program should return 3 because there are 3 non-repeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO non-repeated digits in this number.

For example:

Input	Result
292	1
1015	2
108	3
22	0

Answer: (penalty regime: 0 %)

```
N = int(input(""))

digits = str(N)
non_repeated = set()
repeated = set()

for digit in digits:
    if digit not in repeated:
        if digit in non_repeated:
            non_repeated.remove(digit)
            repeated.add(digit)
        else:
            non_repeated.add(digit)

print(len(non_repeated))
```

	Input	Expected	Got	
✓	292	1	1	✓
✓	1015	2	2	✓
✓	108	3	3	✓
✓	22	0	0	✓

Passed all tests! ✓

Marks for this submission: 1.00/1.00.

Question **2**
Correct
Mark 1.00 out of 1.00
Flag question

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

Input Format:

Single Integer Input from stdin.

Output Format:

Yes or No.

Example Input:

175

Output:

Yes

Explanation

1^1 + 7^2 +5^3 = 175

Example Input:

123

Output:

No

For example:

Input	Result
175	Yes
123	No

Answer: (penalty regime: 0 %)

```
def is_disarium(number):
    num_str = str(number)
    sum_of_powers = sum(int(digit) ** (index +
    return sum_of_powers == number

num = int(input())

if is_disarium(num):
    print("Yes")
else:
    print("No")
```

	Input	Expected	Got	
✓	175	Yes	Yes	✓
✓	123	No	No	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **3**
Correct
Mark 1.00 out of 1.00
Flag question

In mathematics, the factorial of a non-negative integer n, denoted by n!, is the product of all positive integers less than or equal to n. For example,

5! = 5 x 4 x 3 x 2 x 1 = 120

4! = 4 x 3 x 2 x 1 = 24

9! = 9 x 8 x 7 x 6 x 5 x 4 x 3 x 2 x 1 = 362880

Write a program to find the factorial of a given number.

The given number will be passed to the program as an input of type int.

The program is expected to calculate the factorial of the given number and return it as an int type.

Assumptions for this program:

The given input number will always be greater than or equal to 1.

Due to the range supported by int, the input numbers will range from 1 to 12.

For example:

Input	Result
5	120
4	24
9	362880

Answer: (penalty regime: 0 %)

```
def factorial(n):
    if n == 0 or n == 1:
        return 1
    else:
        return n * factorial(n - 1)

num = int(input())

if num < 1 or num > 12:
    print("Input number should be between 1 an
else:
    print(factorial(num))
```

	Input	Expected	Got	
✓	5	120	120	✓
✓	4	24	24	✓
✓	9	362880	362880	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **4**
Correct
Mark 1.00 out of 1.00
Flag question

Given a positive integer N, check whether it can be represented as a product of single digit numbers.

Input Format:

Single Integer input.

Output Format:

Output displays Yes if condition satisfies else prints No.

Example Input:

14

Output:

Yes

Example Input:

13

Output:

No

Answer: (penalty regime: 0 %)

```
def is_product_of_single_digits(n):
    return "Yes" if n < 10 or any(n % i == 0 an

num = int(input())
print(is_product_of_single_digits(num))
```

	Input	Expected	Got	
✓	14	Yes	Yes	✓
✓	13	No	No	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **5**
Correct
Mark 1.00 out of 1.00
Flag question

Given a number N, find the next perfect square greater than N.

Input Format:

Integer input from stdin.

Output Format:

Perfect square greater than N.

Example Input:

10

Output:

16

Answer: (penalty regime: 0 %)

```
def next_perfect_square(n):
    root = int(n ** 0.5)
    while True:
        root += 1
        if root ** 2 > n:
            return root ** 2

num = int(input())
print(next_perfect_square(num))
```

	Input	Expected	Got	
✓	10	16	16	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **6**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program to return the nth number in the fibonacci series.

The value of N will be passed to the program as input.

NOTE: Fibonacci series looks like –

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, . . . and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- seventh Fibonacci number is 8, and so on.

For example:

Input	Result
1	0
4	2
7	8

Answer: (penalty regime: 0 %)

```
def fibonacci(n):
    if n <= 0:
        return "Invalid input"
    elif n == 1:
        return 0
    elif n == 2:
        return 1
    else:
        a, b = 0, 1
        for _ in range(2, n):
            a, b = b, a + b
        return b

num = int(input())
print(fibonacci(num))
```

	Input	Expected	Got	
✓	1	0	0	✓
✓	4	2	2	✓
✓	7	8	8	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **7**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program that finds whether the given number N is Prime or not.

If the number is prime, the program should return 2 else it must return 1.

Assumption: 2 <= N <=5000, where N is the given number.

Example1: if the given number N is 7, the method must return 2

Example2: if the given number N is 10, the method must return 1

For example:

Input	Result
7	2
10	1

Answer: (penalty regime: 0 %)

```
N = int(input(""))

if N <= 1:
    print(1)  # Not prime
elif N <= 3:
    print(2)  # 2 and 3 are prime
elif N % 2 == 0 or N % 3 == 0:
    print(1)  # Not prime
else:
    i = 5
    while i * i <= N:
        if N % i == 0 or N % (i + 2) == 0:
            print(1)  # Not prime
            break
        i += 6
    else:
        print(2)  # Prime
```

	Input	Expected	Got	
✓	7	2	2	✓
✓	10	1	1	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **8**
Correct
Mark 1.00 out of 1.00
Flag question

Given an integer N, check whether N the given number can be made a perfect square after adding to it.

Input Format:

Single integer input.

Output Format:

Yes or No.

Example Input:

24

Output:

Yes

Example Input:

26

Output:

No

For example:

Input	Result
24	Yes

Answer: (penalty regime: 0 %)

```

import math
num = int(input())
new_num = num + 1
diff = new_num - num
if math.isqrt(num + diff) ** 2 == (num + diff):
    print("Yes")
else:
    print("No")
```

	Input	Expected	Got	
✓	24	Yes	Yes	✓
✓	25	No	No	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **9**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program to find the count of unique digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number >= 1 and <= 25000.

For e.g.

If the given number is 292, the program should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the program should return 3 because there are 3 unique digits in this number, '1', '0', and '5'.

For example:

Input	Result
292	2
1015	3

Answer: (penalty regime: 0 %)

```
number = int(input())
unique_digits = len(set(str(number)))
print(unique_digits)
```

	Input	Expected	Got	
✓	292	2	2	✓
✓	1015	3	3	✓
✓	123	3	3	✓

Passed all tests! ✓

Correct
Marks for this submission: 1.00/1.00.

Question **10**
Correct
Mark 1.00 out of 1.00
Flag question

Write a program to find the sum of the series 1 +11 + 111 + 1111 + . . . + n terms (n will be given as input from the user and sum will be the output)

Sample Test Cases

Test Case 1

Input

4

Output

1234

Test Case 2

Input

6

Output

123456

Answer: (penalty regime: 0 %)

```
def series_sum(n):
    return sum(int('1' * i) for i in range(1, n

# Get input from the user
n = int(input())

# Calculate and print the sum of the series
print(series_sum(n))
```

	Input	Expected	Got
